

The Coming Boom in English Lexicography – Reconsidered (Part Two)

Charles M. Levine

Recap. In July 2001, I optimistically crawled out on a limb in these pages talking about an imminent boom in English lexicography.¹ Then in the July 2002 issue, my good friend and colleague Joseph Esposito countered that traditional, legacy dictionary publishers, like OUP and Merriam-Webster, “will muddle along, with growth becoming harder to come by except at the expense of their smaller and declining rivals; eventually they will stop publishing for broad markets altogether and the remaining activity will be to focus on the scraps Microsoft leaves on the floor.”²

As a graduate in the history and philosophy of science, I have always been amazed at the uncanny ability of Esposito, a literature graduate, to anticipate important trends in technology. Possibly I get too

preoccupied chasing down such details as how much, when? For example, how much will online dictionary searches replace print look-ups in the next three, five, and ten years? Twenty percent or 50 percent within ten years? But, as Esposito wrote (in a more general point about the future of traditional dictionary publishing), “Who knows?...In the absence of growth, the old [dictionary] business will be strained for capital, which will beget smaller investments, which will in turn hasten the decline.”

Recently in the States. Certainly during the past two years, American lexicography has shown many of the strains Esposito wrote about. One could say these wounds were self-inflicted through corporate ownership dramas – but no matter, the

Charles M. Levine was recently the vice-president and publisher of Random House Reference Division, and has held a number of senior executive positions in digital and print content management in Asia and the USA. He is currently consulting, agenting, and packaging for a number of publishing clients.

Levine's 'The Coming Boom in English Lexicography: Some Thoughts about the World Wide Web (Part One)', was published in *Kernerman Dictionary News*, Number 9, July 2001.
<http://kdictionary.com/newsletter/kdn9-1.html>

Joseph J. Esposito's sequel, 'Dictionaries, another Netscape?', was published in *Kernerman Dictionary News*, Number 10, July 2002.
<http://kdictionary.com/newsletter/kdn10-1.html>

A view from **Microsoft Corporation**, referring particularly to Esposito's points and introducing their overall policy concerning dictionaries and lexicography, is in preparation by Julian Parish, the recently-appointed Business Manager of Microsoft's new Dictionary Central Group, and due to be published in issue Number 12, July 2004.

cause of lexicography in America was not advanced, and possibly permanently hurt.

For example, Random House Webster dismantled its lexicography staff, as its relatively new Bertelsmann-owned parent grew tired of dictionary making. *Webster's New World*, sold to Hungry Minds (formerly, IDG Books), was off-loaded to John Wiley. *American Heritage*, as part of Houghton Mifflin, went to Vivendi, which then sold it to a private American-led investment group (headed by Bain Capital and Thomas H. Lee). The new *Microsoft Encarta* print dictionaries (created by Bloomsbury in the UK and distributed by St. Martin's in the US), after creating a splash of publicity, retreated in sales at retail. And the recent US\$55 *New Oxford American Dictionary*—by all appearances an excellent product—assumed a dignified, but quiet, presence on bookshelves.

Only Merriam-Webster seems to have gained market share in America at the expense of its smaller competitors, who were hobbled by corporate problems. Currently shipping the new eleventh edition of its flagship *Collegiate Dictionary* (bundled for the first time with an electronic version and a free introductory online subscription – all for US\$25.95), M-W recently boasted a 17 percent increase in dictionary sales, while their website bustled with more than 150,000 daily visits. The private investor (Jacqui Safra) who now owns Merriam, however, in a possible sign of impatience, recently brought in an outside CEO (G. Macomber) to find ways to grow the business more quickly. We will have to stay tuned for what develops at America's leading dictionary publisher.

In the aggregate, though, the American print dictionary market seems to stay at about the same size, year after year, even as online look-ups are apparently booming.³ Is the resilience of print dictionaries in America a good sign? Is overall dictionary use (counting both print and digital look-ups) increasing? Possibly, yes to both questions. If I unscientifically use myself as an example, I now routinely consult two online dictionaries in addition to printed standbys – the OED online (accessible for free as a member of the Quality Paperback Bookclub⁴) and the faithful friend I once published, the *Random House Webster's Unabridged Dictionary* on CD-ROM. If a word still perplexes me, I search Google⁵ or visit well-developed reference sites like Webopedia⁶ (for technical terms). Because of the availability of multiple sources in both print and online, I am now much more dictionary literate – as are, I extrapolate, other serious word users.

Another noteworthy development in the States is the long-overdue progress toward creating the first comprehensive American National Corpus (ANC) – the first 10 million words of which are now being made available. My friend and colleague Wendalyn Nichols says more about this elsewhere in this newsletter⁷.

The Bigger Picture. Looking beyond American shores and around the world, lexicography seems very much alive and well, if not booming to my optimistic drumbeat. The continued use and exploration of corpora and the vigorous linguistic research into world Englishes are two important signs of continued vigor. While at Random House Webster, I helped initiate—with the assistance of Nichols and others—an all-too-brief foray into creating entirely American-bred ESL/EFL dictionaries, partnering with publishers like FLTRP (Foreign Language Teaching and Research Press⁸) in Beijing, under the innovative leadership of Li Pengyi⁹. (Houghton Mifflin created the *American Heritage English as a Second Language Dictionary* in 1997 and revised it in 2002, primarily I believe to reach American schools and colleges – without strong marketing internationally.¹⁰) Except for these efforts the major American dictionary companies still appear blissfully lackadaisical about the potential of the global ELT market – which is probably the single largest area for growth in the English-dictionary business.

Maybe it would be more accurate to say that the global reach and penetration of English—especially as reflected on the WWW—will keep linguists and lexicographers busier for some time to come analyzing and mediating exchanges in which English is the lingua franca, and helping build the next iteration of the WWW, called the Semantic Web.

In the absence of an American corpus, for several years I have relied on the Web as a surrogate. For example, in a pop-reference book on Yiddish I co-created, playfully entitled the *Meshuggenary*¹¹, the Web was the best source of finding current uses in English of Yiddish-origin words and phrases (see the sidebar).

I am grateful to Michael Rundell, editor-in-chief of the *Macmillan English Dictionary for Advanced Learners*¹², for alerting me to the forthcoming special issue of *Computational Linguistics*¹³, edited by Adam Kilgarriff and Greg Grefenstette, which will be devoted to the question of the Web as a corpus. Rundell notes that there are “many computational linguists who are beginning to see the Web as

the only corpus worth looking at (well, maybe I exaggerate somewhat), and as the solution to the long-running problem of ‘data-sparseness’.”

Of course, as Kilgarriff and Grefenstette point out, search engines like Google still have significant limitations as lexicographic tools—for example, in giving too much weight to words in the titles and headings of Web pages, and in missing the vast volume of material now hidden from the eyes of search engines behind “fee walls,” in archives that charge to retrieve documents—but nonetheless it is clear that the Web presents lexicographers with a whole new set of opportunities to research current language use and should be considered a valid linguistic corpus.

Rundell also pointed out the heating up of discussions in the UK and Europe about English as a lingua franca – a development that looms so large throughout the world that it can still actually seem invisible to many native (English-centric) speakers. I noted in my first installment that an estimated 80 percent of Web pages are written in English (though that percentage may actually decrease somewhat over time; for example, Internet Explorer now supports the use of dozens of special scripts of the world’s languages).

Somewhat hidden to those outside of Europe is the growing role that English plays (and a controversial one at that) in the affairs of the European Union. In 1970, about 60 percent of all documents coming out of Brussels were written in French, few if any in English. By 1997, English (45 percent) had surpassed French (40 percent) as the most frequently used official language.¹⁴ (Is it less CNN, MTV, and MacDonald’s that so haunts the French than ELF, English as a Lingua Franca? As language buffs, we can be sympathetic about the potential decline of any vibrant language.) The Semantic Web should further accelerate the use, promulgation, and importance of ELF. And by providing even richer data for research, the Semantic Web should also accelerate the business of global linguistics and lexicography.

The key step in building the Semantic Web will be the addition of metadata URIs—Universal Resource Identifiers—that “define or specify an entity, not necessarily by naming its location on the Web.”¹⁵ Put simplistically, the Semantic Web will establish protocols to identify types of content on each Web page – in ways to make the content elements computer readable and useable. As Tim Berners-Lee, who laid the groundwork for the WWW, writes:

The Semantic Web, in naming every concept simply by a URI, lets anyone express new concepts that they invent with minimal effort. Its unifying logical language will enable these concepts to be progressively linked into a universal Web. This structure will open up the knowledge and workings of humankind to meaningful analysis by software agents, providing a new class of tools by which we can live, work, and learn together.¹⁶

I am obviously skipping lightly over a number of important new works-in-progress that will profoundly affect linguistic and lexicographic research in the coming years. (Searching on Google for the phrase “Semantic Web” plus “lexicographer or lexicography,” restricted to English pages cached in the past year, yielded about 850 results, with a number of fascinating leads to recent papers and conferences. Adding “linguist or linguistics” to the search criteria increases the results to 4000.¹⁷) Work is just gearing up, and while I bemoan not having more hard data and numbers, my instincts tell me that lexicography and linguistics are on the verge of a revolution as a result – though, sadly for me, much of this new linguistic and lexicographic innovation may take place outside of America, even ironically as American-English is the driving force behind the increasing global use of English.

Postlude

Some interwoven comments follow, from those whose help in writing this article has been most welcome and appreciated.

Rundell: There’s definitely a big growth in corpus development worldwide (especially but by no means exclusively for use in dictionary making) – sometimes, it seems, almost anywhere but the US. The big Japanese publishers like Kenkyusha and Shogakukan are all partners in the ANC consortium, but also busy with corpus development of their own. There is, for example, a 100-million-word Corpus of Professional English under development in Japan.¹⁸

Levine: All this corpus work is immensely exciting, and it is going to be interesting to see how it will influence the look and feel of future native-speaker dictionaries of English as well.

Instant Yinglish – Google’s Top Hits

(adapted from the *Meshuggenary*)

Searching on google.com gives a good indication of which Yinglish words are most frequently used today. **Glitch** and **kosher** top the charts, way ahead of all the rest; while even such well-known Yinglish words as **nosh**, **knish**, **schnoz**, **schmuck** and **gonnif** seem to have fallen behind in popularity, if one accepts Google’s results. With the following list, you’ll be instantly up and running in Yinglish.

glitch Slip-up; bug in the system. [232,000 hits]

kosher Legit, on the up-and-up; ritually clean. [222,000]

bagel The doughnut-shaped bread of champions. [145,000]

maven Expert; pundit; smart aleck. [70,800]

yid Jew, pronounced <yeed>. (But use with care: in U.S. slang, pronounced with a short i (as in bid), it is very disparaging.) [62,800]

klezmer Lively, heart-tugging Yiddish folk music. [46,800]

mensch Decent, trustworthy person. [42,600]

tush Backside; rear end. [39,500]

schlock Cheap or shoddy goods; junk. [39,300]

klutz Clumsy, inept person; blockhead. [39,000]

schmooze To chat or gossip; by extension, to network. [38,100]

chutzpah Impudence; moxie; cojones. [32,700]

The above results were derived from searching about 80 Yiddish-origin words that are now accepted in standard American English and would appear in up-to-date larger or unabridged dictionaries. The search was restricted to English Web pages, searching on word clusters such as [glitch glitchy], to take into account alternative spellings and closely related uses.

Kernerman: The implications may be more far-reaching and actually concern other languages too, not just English. For example, expect a dramatically growing demand for bilingual dictionaries of “unorthodox language-pairs”, including so-called non-major languages, be it Icelandic/Korean, Latvian/Slovene, etc.

Levine: One of the key developments that I hope to see is the sharp increase in the quality of these dictionaries covering odd bilingual couples.

Esposito: I see a rhetorical error in the paper – rhetorical, not substantive. You are using my paper as a pushing-off point, which is fine: I have been a straw man before. But the contrast is imprecise: you are referring to lexicography, I to dictionary-makers. Lexicography is bound to grow. The current crop of dictionary companies can’t grow. Apples and oranges.

Levine: There actually may be two lacunae in what I write: (1) The boom may be more in computational linguistics than in lexicography as such, especially when it comes to the Semantic Web. Separately, I learned, for example, that many students who major in linguistics go on to careers in software. (2) I am implying if not stating that because of ELF, you could grow the dictionary-making business; but I fudge about addressing the key question – whether you could make it a “growth” business. It’s somewhat like talking about the U.S. economy. If it grows at only 1-2% a year, it would still be considered an investment crisis. You are saying you doubt dictionary making as a business can grow at all and will decline.

Esposito: I think you can grow any business that adds value beyond the default value of a bundled Microsoft dictionary, and learners’ dictionaries add value.

Levine: But, I do not fully address the

O brave new worldictionaries

Ilan J. Kernerman

Miranda O, wonder !
How many goodly creatures are there here !
How beauteous mankind is ! O brave new world,
That has such people in ’t !
Prospero ‘T is new to thee.
(W. Shakespeare, *The Tempest*, Act V. Scene I.)

When I began working in dictionaries in the early 1990s, our prime concern was the advent of English as a lingua franca—ELF (also here by Levine)—and its forthcoming consequences, for everyone to now learn and use worldwide, in equilibrium with their native language. This trend has indeed evolved, with critical impacts and interactions of various sorts.

Meantime, while we were snoozing, within that arguable globalization process—disseminating communication and information, grinding all into ubiquitous uniformity and mediocrity—other languages have also been awakening to each other and to themselves. Although ELF is champion—simultaneously and complementarily—it has become necessary and easier to create dictionaries for unorthodox language pairs, as well as to reach and explore—and sometimes even safeguard and enhance—any language still spoken.

With growing direct contact between languages not involving English, there are more trilingual and multilingual persons who want bilingual dictionaries without English, or dictionaries with two or more languages and ELF as an underlying bridge. Their quality might be painstaking to start with, but improvement usually follows suit. One way or another, soon you will be able to get any kind of dictionary, and via modern

magic—such as Wi-Fi, broadband, cellphone—virtually anyhow, anywhere, anytime.

Some forecasts—such as teasingly or skeptically by Esposito—warn against the ill effects of such bliss on the traditional business of dictionary making. Yet, life forever intermingles so-called good with bad, bad with good, counter-running contradictions in cohabitation, bringing all together and centralizing, whilst breaking farther apart into atoms, quarks and who knows what next. So, big feed on small, the small disappear, yet big transform too. Giants come and go, while little men and women bear on. Change is—as Prospero might say—“such stuff as dreams are made of”. You can tickle the Establishment, but the Establishment never goes away; its characters may be replaced but the roles remain.

Dictionaries pertain to civilized society, with an aim to confine the lawless jungle into order and fairness. How sad when they succumb to this very same jungle law, such as the recent change in Random House, which meant a mortal blow and terrible loss. On the other hand, I cannot lament the fate awaiting—according to Esposito—whichever legacy dictionary publisher whose so-called quality is undermined by a big name. The defamed Microsoft dictionaries could—eventually, if not yet—not be worse than theirs.

Sadly, established brand names are often something to beware of (so no surprise if sacred-cow slaughter becomes a global hobby). When their originality has evaporated ages ago, big names get fat and preoccupied with self-preservation and enforcing monopoly, then impede the advance of new spirits whom they copy. That is not a trait of dictionaries, but of humankind.

key point (because it is so hard to pin down), which is whether you could grow a dictionary business enough to attract serious investment money. The sad truth of the matter is that it may be difficult that one could. A little growth is not enough, and there hangs a tale (as you would say) – a tale of most of the corporate problems we have recently seen in American dictionary companies, including Merriam-Webster. Even if you could grow a dictionary business, under ideal circumstances, the growth may not be interesting or attractive enough for investors, American-style ones at least.

Other publishing entrepreneurs with a more worldly view, might be willing to accept a little growth. What puzzled me most, for example, about the dismantling of Random House Webster was that the dictionaries could be of immense benefit to the global branding of the Random House name, which fits in with the Bertelsmann global view, although not necessarily with the one emanating from the Broadway headquarters. For example, I am told that the Random House name is well known in both Japan and China, largely because of the local translations of the *Random House* dictionaries. But the latter benefits were apparently not strong enough to overcome the issue of growth for Random House/Bertelsmann.

I do lament this development, not only out of self-interest, but selfless interest when it comes to many good American lexicographers whose careers are being turned upside down by the stranglehold that dummies seem to have on dictionary publishing in the States today. But, all this is a natural process, in which the mighty fall by the wayside—out of hubris, complacency, or too much past success—and room is created for new scrappy small guys who are willing to take risks and innovate.

2 <http://kdictionaries.com/newsletter/kdn10-1.html>

3 I roughly estimate that the combined size of the American monolingual dictionary business—measured in total annual sales dollars and including dictionaries sold directly to schools, exported abroad, as well as electronic versions—falls somewhere in the range of US\$80-100 million annually. This number does not appear to have grown much during the past decade. One could point out that sales of electronic dictionaries, like the *Microsoft Encarta World English*

Dictionary, do not seem to have greatly added to the total sales dollars, because of bundling with other products and/or the purchase of an electronic product in substitution for an equivalent one in print. This is all, of course, educated guessing.

9 *The Random House Webster's Easy English Dictionary*, New York: 2001, paperback US\$12.95, was certainly the first entirely new American English dictionary written specifically for middle school learners, a rapidly growing and underserved market around the world. In China, for example, soon every student, from the earliest grades, must master three core subjects: Mandarin, mathematics, and English.

10 One should also mention the *Newbury House Dictionary of American English*, edited by Philip M. Rideout, and published by Heinle in a revised edition in 1999. There is also a basic edition.

Although Heinle is not a major dictionary publisher, these two editions are, according to Nichols, giving Longman a run for its money in the intermediate ESL market. McGraw-Hill, like Houghton Mifflin, has a small ESL group as well that tries to reach the domestic U.S. market.

English Dictionary Making in America Today

Wendalyn Nichols

Wendalyn Nichols is the former Editorial Director of Random House Dictionaries, and prior to that the Editorial Manager of Longman Dictionaries. She is now a freelance consultant and lexicographer, and is on the advisory board of the American National Corpus, the board of the Dictionary Society of North America, and the advisory board of Montclair State University's graduate linguistics program.
wendalyn@nyc.rr.com

Why the UK still leads the way in the development of monolingual learners' dictionaries

The pioneering work in lexicographic publications for non-native learners of English was done in the UK, and the US has never really caught up. There are many reasons for this; the main one, I think, is the large size of the native speaker US domestic market combined with an unwillingness to cater to the special needs of immigrant populations; the prevailing attitude until the 1960s was the "bootstrap" mentality: "I (or my forebears) pulled myself up by my own bootstraps, and you should too."

The isolationism that prevailed in the US until the Second World War meant that few publishers saw the need to serve international markets, and domestically the US is such a large market for school publishing that the local educational publishers found it more lucrative to concentrate on producing school dictionaries geared toward the specific grade levels in elementary school and high school (called "elhi" for short). In contrast, Britain had a large empire (gradually replaced by the Commonwealth) as a ready-made market of people who needed to learn English (as a foreign language) to get ahead.

Once US publishers woke up to the need for special dictionaries for learners of English as a second language, they concentrated mainly on their already-established customers in the US market, specializing in literacy programs and bilingual (Spanish-English) education. These programs did not stress dictionary skills; at the lower levels students relied heavily on their bilingual dictionaries, and at the higher levels students were encouraged to switch to a standard native speaker dictionary.

Enough teachers admired the British EFL dictionaries that the *Oxford Advanced Learner's Dictionary* sold well in the US, and then Longman established a foothold in the 1970s. The *Longman Dictionary of American English* (LDAE) became the best-selling title once it was published in 1981, even though it wasn't truly American, being patchily Americanized from the *Longman Active Study Dictionary*. American publishers stuck to their elhi dictionaries, and so the British and US publishers happily split the market.

Why US publishers have been slow to create corpus-based dictionaries

The reason to keep up with the latest scholarship—like corpus-based lexicography—is an economic one, and too often reactive: if your books stop selling, then you figure out why. In the UK, the rivalry between Oxford and Longman, and the entry into the market of the COBUILD dictionary, meant that to keep up, everybody had to jump on the corpus bandwagon. US publishers, who were content to let the UK publishers have this slice of the market, did nothing about the new trend. Heinle & Heinle was the first US publisher to attempt an all-American ESL dictionary (the *Newbury House Dictionary of American English*), distinct from the Americanized ones coming from Britain, but it was written by one man rather than a team, and had no corpus input. Random House made the same mistake with its first foray into the monolingual ESL market, *Random House Webster's Dictionary of American English*. Now, it has always surprised me that a high percentage of US teachers prefer the Newbury House dictionary with its made-up example sentences to the second edition of the Longman one that is corpus-based; they like the pedagogical nature of the former. They'd gotten used to the first edition of LDAE, which pre-dates corpora and has example sentences that use a limited vocabulary.

It takes a lot of money to develop proprietary corpus data, and there was no equivalent initiative in America to the British National Corpus (BNC), because the US government has never supported lexicographic scholarship in the way that the UK has, and it's my understanding that the BNC would not have been possible without a huge chunk of money from Whitehall. At that time—the late 1980s and early 1990s—the ESL publishing market was undergoing great upheaval, with mergers, buyouts, acquisitions and divestments happening with such dizzying speed that even those US publishers who were aware of the "corpus revolution" could not convince their management to approve a significant, long-term, capital investment. Houses like Random House that did not have a history of selling into the ESL market didn't have the mergers problem to deal with, but they had the problem of financial models that no longer allowed for long-term amortization.

So, the UK educational publishers who have the greatest penetration into the US ESL market—Longman, Oxford, and to a lesser extent Cambridge—already have dictionaries now, and the US educational publishers remain unable to get approval for the kind of funding it would take to produce a product line that would rival the UK titles. McGraw-Hill ought to have seized the day—they had the cash, the sales penetration, and the size—but they chose instead to strike deals with other publishers to present their products to this market. NTC, the National Textbook Company, produces a large line of dictionaries that are, in my view, second-rate, but which people buy because they're cheap.

There is now the American National Corpus (ANC) Consortium, which got investment from enough publishers to start work that is modeled after the BNC so that comparative studies can eventually be done. The first 10 million words are being released this summer (2003). The initial founder investors have exclusive access during the developmental period; other commercial houses that wish to invest may still join, but at a higher fee than was the case for initial investors. Non-commercial educational institutions and individual researchers also have access from the start. The texts are being gathered under the supervision of Randi Reppen at Northern Arizona University; they are being tagged at Vassar under Nancy Ide; and the resultant corpus will be housed on the servers at the Linguistic Data Consortium at the University of Pennsylvania, which is also administering the licenses. (See next page.)

At this point, I see the UK and Japanese publishers as being more likely to take advantage of the ANC than American publishers, and for the disparity between British and American products to continue. I wish it weren't so; Charles Levine and I had great plans for the application of corpus-based lexicography to the Random House line, but what can you do when the visionaries don't hold the purse strings, and the upper management changes so often that you don't have a track record with them you can point to so that they trust you with large investments? This is the problem in nearly every US dictionary house; the one healthy one, Merriam-Webster, has so far remained unconvinced about introducing corpus-based lexicography. American consumers, meanwhile, will continue to make Merriam-Webster native speaker dictionaries their number-one choice; ESL teachers and students will continue to buy Americanized UK products.

The health—or otherwise—of US dictionary publishers vis à vis UK publishers

The top management of the big publishing groups look at the bottom line: dictionary publishing does not make the margins they like to see, so they are perennially putting pressure on the dictionary units to cut costs.

Merriam-Webster is the only major American dictionary publisher that is not under financial threat or at least dealing with perennial uncertainty: the publishers of the American Heritage line at Houghton Mifflin are still settling down after being sold by Vivendi; Random House closed its division in 2001; between 1997 and 2002, Webster's New World had three different owners. Encarta, the corpus-based UK-US collaborative project that was supposed to mark a new breed of dictionary, was done so quickly and edited so poorly that it was a near-complete failure: you now see copies of it everywhere on bargain book tables and street vendors' stalls next to the cut-price brands, because it had unprecedented numbers of returns of unsold copies from booksellers.

The Random House line, especially the great Unabridged Dictionary, is in danger of the fate of declining without any revision, unless another publisher decides to buy the rights to the Random House dictionaries and revive them. The current managers have even moved all of the citation cards into a storage facility where they cannot be readily accessed by anyone! Corporate changes are definitely a threat to the revision schedules and the very existence of the larger US dictionary publishing units.

Outside the US, American products simply do not have enough sales success to make an impact. The few exceptions, I think, included the works that Random House had the foresight (in the old days) to license for translation in Japan, Korea, and China – the beautiful editions of the Unabridged and College dictionaries that made Random House a respected name in East Asia. The American lexicographic tradition for native speaker products is long and illustrious, but the commercial climate has taken such a toll that the most brilliant lexicography now happens in specialized areas: Jonathan Lighter's *Historical Dictionary of American Slang*; the *Dictionary of American Regional English* project under Joan Houston Hall; and the recently-completed *Middle English Dictionary* at the University of Michigan, are examples.

Britain, in contrast, still maintains a commitment to promoting the English

This article comprises slightly revised extracts of Wendalyn Nichols' answers to questions in an interview conducted on-line with Charles M. Levine and herself by Rex How, publisher of Net and Books in Taipei, and published in late 2002 in Chinese translation on www.netandbooks.com and in the *mook* (magazine-style book) number 5: *A History of Dictionaries*. The original English text, including Levine's answers is online: <http://kdictionaries.com/kdn11-02-interview.html>

language that is lacking in the US, so the UK-based publishers are less eager to divest themselves of dictionary units. The only dictionary house in the UK to undergo significant restructuring in recent years is Collins (the company is now HarperCollins), and this may have much to do with the fact that it is now owned by Rupert Murdoch's NewsCorp. Its schools assets in the US were sold to Pearson (Longman's parent company) in the 1990s; the COBUILD project was closed in the late 1990s because the sales of the product were disappointing. Collins still owns COBUILD and keeps updating it, but the lexicographic unit that produced it is no longer in operation. The dictionary program now concentrates more on native speaker and bilingual titles, and is based in Glasgow.

Having said that, it is becoming increasingly difficult for any commercially-owned unit, such as Longman Dictionaries, to get approval for new innovative capital projects – they seem to be in the “let's revise what we've got for now” mode. As for the two university presses: Oxford is also penny-pinching in most areas (it's more focused on its biggest capital project, the third edition of the OED); its Americanization of the *Wordpower* dictionary is not selling well. Cambridge now has a New York office and recently produced an American dictionary to compete with the LDAE, but its sales penetration is also disappointing.

What it will take to be a lexicographer in the future

The quality of a lexicographer will still depend heavily on all the traditional skills, as well as talent. I've trained plenty of people who learned the basic concepts but never became truly good, instinctual lexicographers – and unfortunately there are too many people out there who've had lexicographic training whose work is really quite patchy. Anybody can be taught the basic principles in a university course or an in-house training program on lexicography, but it takes someone with an instinct, an ear for the language—a poet, I would argue—to find just the right genus and differentiae and commit those to paper (or electronic database!) within the restrictions of a particular style guide.

A lexicographer will still need to have something of the teacher in him or her: an ability to convey complexity in a clear, simple, consistent form. A lexicographer will still need an unerring knowledge of grammar and a curiosity about usage and new words that keeps him or her alert to changes in the language – new words, new

uses, shifts in sociolinguistic register. He or she will still need to be able to interpret citations, which have their own role to play in an active reading and marking program alongside corpus data. He or she will still need a keen attention to detail.

The skills required of a lexicographer going forward are also going to include an ability to analyze corpus data quickly and judiciously, identifying and differentiating significant patterns from “rogue” uses of language, and making allowances for any bias the corpus may have. The lexicographer will have to understand data tagging and be able to work in an electronic medium, manipulating entries across databases.

Electronic applications and consumer (non-)awareness

There are some good CD-ROM products on the market from reputable companies, and then there are a lot of bad products with very old data sets being offered for license at bargain-basement rates. You get what you pay for. Electronic handhelds are still limited in their usefulness and helpfulness because of the limitation on memory; I think that wireless handhelds could solve that problem. That's where the future is, so whoever is first at successfully manipulating their data into a compelling, flexible, and useful format for wireless access, and can strike exclusive deals with the main manufacturers, is going to make a lot of money.

The perennial problem is that consumers the world over do not know how to tell a good dictionary from a bad one – it doesn't matter if it's print or electronic. They look at the number of definitions the product claims to have, and buy the one with the largest number. And the manufacturers of these devices often choose the cheapest licensing deal they can get rather than the best content. About the only defense against this is strong consumer awareness campaigns – if a manufacturer were to choose a high-quality licensing partner (or develop its own high-quality English content) and then hit the market with a very strong marketing campaign that focused on the quality of the product, educating the consumer in the process, then it might make a dent in this trend. That's how Longman beat out Oxford in many markets: they were quicker to exploit corpus resources and more innovative in their applications, and were able to demonstrate the difference in a global blitz of teacher-training workshops and conference presentations. Therefore, schools that teach English ought to be teaching the students how to choose a dictionary; you're not going to convince

manufacturers to reform their practices, so you've got to teach the consumer not to buy the inferior products.

The Internet also contributes to the confusion of quantity—or ease of access—with quality. Being mindful of the quality of the source matters, regardless of whether the delivery format is print or electronic. I think it was a mistake to offer online dictionaries for free – the newer works that are still under copyright and are the most up-to-date should have been set up with a subscription model from the beginning. Internet users now feel that they have the right to free information, no matter how much it cost the original publisher to produce it. Some publishers, like Columbia University Press, have been successful with encyclopedic works offered online by subscription, and I think people will start to accept this model, especially now that companies like Napster have been barred from allowing free music downloads of copyrighted material.

Some Lexicographic Concepts Stemming from French Training in Lexicology (Part One)

Jean Pruvost

Jean Pruvost is the Vice-President of Université de Cergy-Pontoise, where he teaches linguistics, lexicology and lexicography, directs the laboratory of the CNRS [National Centre for Scientific Research] (Metadif, UMR 8127) that is devoted to dictionaries and their history, and organizes the annual international dictionary conference, *La Journée des dictionnaires*, a meeting point for lexicologists, lexicographers and dictionaryists. He is the author of *Dictionnaires et nouvelles technologies* [*Dictionaries and New Technologies*], for which he received the international linguistics prize *Logos* in 2000, and of two titles in the *Que sais-je?* [*What Do I Know?*] series, one on French language dictionaries, the other on neologisms (with Jean-François Sablayrolles), as well as of numerous articles. Professor Pruvost co-directs, along with Bernard Quemada, two collections at Éditions Honoré Champion (*Études de lexicologie, lexicographie et dictionnaire*; *Lexica*), serves on several editorial boards (*Cahiers de lexicologie*; *Études de linguistique appliquée*; *International Journal of Lexicography*), and presides the Association des Sciences du Langage.

Introduction

On the occasion of the Euralex Congress held in Copenhagen in August 2002, as a French lexicologist and lexicographer in contact with my colleagues who express themselves in English, three strong ideas crossed my mind:

- first, there was obviously a great deal for a French specialist to learn from my non-French colleagues in their specific approach to our discipline;
- then, from the outset it seemed to me that so far there have not been many exchanges between the French attitude and English and American ones;
- finally, I realized that if I have learnt a lot from my colleagues and friends, I may have also certain points of view and methods that are peculiar to my training, which could effectively take part in our collaborative study.

Also, encouraged by Ilan Kernerman for whom this conference was particularly stimulating, as well as by Tony Cowie whose benevolent dynamism I admire, I agreed to try to present some of these ideas which form a part of my creed and my training within the framework of this newsletter. Three perspectives seemed to me particularly interesting to develop.

The first corresponds to the distinction to be set between “lexicography” and “dictionary”. The recent notion of “dictionary” has actually been introduced by Bernard Quemada, director of the *Trésor de la langue française* [*Treasure of the French Language*] (16 volumes: 1971-1994), and it has been adopted fruitfully by numerous French lexicologists. This seems fundamental to me.

The second perspective is the one developed by Robert Galisson with regard to “lexiculture”. Galisson is one of our most original and efficient lexicologists of French as a foreign language. Actually, lexiculture is probably one of the most neglected components in the editing of entries in French or English dictionaries, sometimes even completely forgotten.

The third perspective is what I call the “triple dictionary investigation”. Some lectures I gave on the subject have convinced me that this particular approach may very likely have its virtues for the improvement of our dictionaries.

1. The useful distinction between lexicography and dictionary

In order to understand the difference between lexicography and dictionary and to perceive their essential complementarity, it is necessary to situate it in the recent history of French dictionaries which, more or less, is not very far from the history of lexicography in other western countries. One can actually distinguish four successive moments during the second half of the 20th century.

1.1 Lexicology disassociated from lexicography, in the traditional sense of the term

From 1950 to 1965, a first period distances itself on the whole wherein a distinction is made between “lexicology”, the scientific study of words, and “lexicography”, in the traditional sense of the term, that is the actual developing of dictionaries. We do know that lexicology as a study of words has not really attained the range of a scientific discipline until the second half of the 20th century. In France, a certain date is symbolic in this regard, it is actually in 1959 that the first issue of the *Cahiers de lexicologie* [*Journal of Lexicology*] appeared, and this scientific journal that was established and run by Bernard Quemada would cross the mark of the 21st century, with no less than 78 issues and an undeniable scientific success.

During this first period, lexicology and lexicography in the classic meaning of the word have each redefined itself and the one in relation to the other, lexicology becoming simply a scientific discipline, and lexicography clearly assimilating simultaneously to both a know-how and a science.

The lexicologists, while fully adhering to the continuity from philology, then assess the new-born structuralism and those present-day technologies, technologies offered at that period by punch card machines. To study the lexis and the vocabularies of big corpora with the aid of punch cards, such is the pioneer issue of this period. It is notably at Besançon, in the laboratories equipped with punch card machines, where the lexicologists from all over Europe were trained. Thus, in June 1961, a symposium, which today bears symbolic value in my eyes, is organized by Quemada at the University of Besançon, about the mechanization of lexicologic

research, a symposium altogether representative of the new state of mind which sets in. What does actually declare one of the participants, the Reverend father Busa, director of “Centro per l’automazione dell’analisi letteraria” from Gallarate, near Torino? “One is aware that all of us who take part in this conference, are pioneers of the automation of lexical analysis. We illustrate a necessary role in the evolution, which is the process of the book [...]. Today, alongside the printed journals and books, finds a place for itself the *electronic book*”. Such a declaration, in 1961, deserves to be qualified as visionary! It shows in any case that lexicology is assuming a new dimension derived from the new technologies that are being born.

As for the lexicography of this period, it is distinguished in France by the awareness that dictionaries should rely on a greater analysis of the criteria which define them. The dictionaries escape the isolated role of tools in order to become the object of a new reflection.

There is interest notably in the idea of *Dictionnaire du français fondamental* [*Dictionary of Basic French*] (1958), in the lign of “basic English”: this dictionary of basic French derives from a scientific experience with didactic perspective, being based on an analysis of vocabulary frequency. While awaiting a new great dictionary of the French language, a big dictionary that is symbolic of the 19th century is republished, the *Dictionnaire de la langue française* [*Dictionary of the French Language*] by Littré (first edition, 1873; reprinted in 1956). At the same time, in preparation, through the *Grand Larousse encyclopédique* [*Great Larousse Encyclopedic*] in ten volumes (1960-1964), the first defining steps are established for using new technologies, those of that time, namely 400,000 punch cards formed upstream of this paper dictionary. An *encyclopedic dictionary* but functioning also in the domains of language and technicalities, this *Grand Larousse encyclopédique* deserves to be remembered as one of the seminal dictionaries of this period. We do not tackle yet the computer era in the precise sense of this term, but the very rigorous methods, based on the algorithmic analysis, are already at work.

However, for the moment, lexicography may still keep its traditional meaning: it is comparable actually to the compilation of dictionaries, making use according to the circumstance of the best adapted technologies, and based on teams that are increasingly professional.

1.2 The birth of *metalexigraphy* and the new distinction *lexicography*/*dictionary*

The second period runs in general from 1965 to 1980, marking a moment when the dictionary benefits from a new status, being largely recognized as an object of scientific research. A French thesis entitled *Les dictionnaires du français moderne (1539-1863)* [The dictionaries of modern French (1539-1863)] (Didier, 1968), a dissertation made thanks to Quemada, sets itself as a parting point for numerous studies that will flourish concerning this or that past dictionary. A new discipline is thus given birth: *metalexigraphy*. *Lexicography*, until now, mainly tied to a daily need, observed above all as a tool, is henceforth part of corpora that is studied in order to better understand the history of the genre and the functioning of the language. In so doing, the dictionaries begin to be not only the creation of philologists and excellent craftsmen, they become a matter for linguists as well.

This second period coincides with a moment of intense commercialization of the dictionaries towards the general public, and a real revolution in information technologies, elevating the dictionary, in the classification of data and their interpretation. Actually, the research domain of the lexicon assumes a new scope, just as it becomes easier to produce dictionaries based on different computerized databases, adapting them for different sorts of public. Bernard Quemada introduces then a new dichotomy, between “*lexicography*”, to which he gives a new meaning in relation to its traditional sense, and “*dictionary*”, both concepts forming a useful dichotomy while being complementary.

Within the new contrast instituted between *lexicography*, in its new definition, and *dictionary*, *lexicography* exceeds well beyond the action of editing a dictionary to be compared to a real scientific research, driven by the words and their inventory, with all the defining works that correspond to it.

Dictionary represents in contrast all that is related to the concrete aspects of the production, of the presentation, for a given public, with all of the commercial imperatives that are imposed in order to please the public.

With *lexicography*, one is really placed in the domain of the research, without being preoccupied about according value for a non-initiated public, without worrying about adapting the content for readers who buy a product. One is somehow well above the dictionary that is put into shape in

Parts Two and Three of this contribution will be published in issue Number 12, July 2004.

All general references to lexicographers and users in this article, using *he/him/his*, apply to both male and female persons.

This article has been translated from the French language. The original French manuscript is available online: <http://kictionaries.com/newsletter/kdn11-03fr.html>

I am most obliged to Anthony Cowie for his dedicated and competent assistance with the English language version. Inefficiencies that might concern any aspect of the translation are my own. IJK

order to be sold, set in pure research. There can even be *lexicography* that, as opposed to the common definition of lexicography comparable to the compilation of a dictionary, does not necessarily lead to a sold dictionary. Corresponding to such or such research on the groups of words, on their definition, it may very well not leave the laboratory and correspond, for example, to the computerized bases designed uniquely for researchers. There isn't here the concern for grading the information for a seductive product in a purchasable form.

Dictionaric – a word that Charles Nodier has already used in the 19th century, but which has fallen into oblivion until Quemada resurrected it – defines for its part the act of developing a dictionary as a product, offered for sale, with all the constraints and problems related to each production, as an instrument for consultation, cultural media conceived with intention for a determined public of potential buyers. Thus, one must never forget that the dictionary represents a technic-commercial product whose content is defined in function of the means that are granted to it for a defined clientele, in the framework of a study of a specific market.

Thus, let us take for example two dictionaries that are very widespread in the French-speaking world and which are considered as having high quality, in this case the *Petit Robert* [*Little Robert*] or the *Petit Larousse* [*Little Larousse*] (be reminded that on average 200,000 *Petit Robert* are sold each year, and 800,000 *Petit Larousse* annually, thus over one million copies in 2001). When a new edition is offered (every year since they are bearing a date) and it is necessary to add a new word in a certain page, it is out of the question to recompose at the beginning of each school year the entire printed dictionary, so this or that example is simply removed from another entry on the same page, or such or such meaning, to gain the several lines which will allow to insert this new word without touching the beginning of the page and its end, and therefore not having to modify the preceding pages and those that follow. Here one is plainly in *dictionaric*: these are the practical restrictions that are imported to the defining quality and precision.

It is possible also, to better illustrate the difference that exists between *lexicography* and *dictionaric*, to assert that one may be an excellent lexicographer, that is carry out effective researches on the groups of words, on their definitions, and still turn out to be a lousy dictionarist, that does not succeed to respect the production timetables and the

inevitable material restrictions imposed. You therefore see great dictionaries that in their first editions have the advantage of enormous entries, making them almost illegible, then as one goes along, because the space will be lacking and it has already been necessary to increase the number of volumes that was initially expected, the entries get thinner, and you can even find yourself at the end of the alphabet with poor entries.

The publisher does not get confused with being a researcher, they must necessarily sell the product according to a selected size for a public to be seduced in a given price, during a certain period: the dictionaric is their first priority. The rule has no mystery: if the product is inappropriate, excessive, inconsistent in the density of information provided, the dictionary as a product will have no success, it will not sell, and the publishing house will be in danger.

Whatever the case is, lexicography and dictionaric are complementary: there is actually no interesting dictionaric if it is not based on solid lexicography, and lexicography is sometimes more efficient if it knew how to account for the dictionaric's constraints of time and of space which, in a certain way, maybe frame it and enhance it to more homogeneity in the description of a large group of words.

1.3 A revealing distinction of basic principles

It is possible to retain several lessons from this necessary distinction between the lexicography and the dictionaric.

First of all, it is important to separate the two perspectives, lexicographical and dictionaric. A dictionary, therefore a product, in which the two perspectives will be confused risks being very disappointing with respect to the user's expectations. The user wishes in general to have precise information, yet not stifling. If he buys for instance a thousand-page book, he will rather have useful and clear information than information that tends to be exhaustive and that transforms each entry to a reduction exercise, into a dreadful digest. To want always to give the maximum information in the minimal space, is to condemn the reader to reading with a magnifying glass, to an intellectualized reading of "researcher". Has one reflected, for example, that the dictionary represents a genre in which the editor refuses in principle any stylistic verbosity, that being considered out of place? This is the chase of the superfluity, the object is scientific and in this capacity, it should, one assumes, be austere.

Note, however, that the first monolingual French dictionaries, those of the 17th and

18th centuries from which they exude great charm, do not seem at this point restricted by a scientific rule, of nearly monastic nature, governing the entire work. Always to save space, by condensing as much as possible, in order to add new information, is not a good habit. Outside the “dictionary” genre, in the works with didactic nature, the verbosity is indeed very present, not to say essential, for the explications. It allows to space out the information, to make it accessible, digestible, it offers also the possibility to propose diverse approaches. Too much dense information definitely contradicts the efficient information, while harming the pleasure of the consultation. In the absence of a dictionary that enables straightaway this flexibility of editing, in the absence of a dictionary that knows how to limit the lexicography to a certain degree in order to add all the dictionaric that is convenient, that which will make the reading of the dictionary pleasant, you no doubt lose one of the primary functions of the dictionary: to make the information clear but also pleasant, legible. It is easy to add the dense information in the name of the lexicography, it is difficult to limit yourself and to choose in good dictionaric the most suitable text.

Then, to consider the result of the research as the editing of an article that should account for it in a hundred percent, is to confuse the stages. There is a time to conduct the research, to thus do the lexicography, with in the end an entry intended for the sole researcher; there is another time to adapt the results for the user, to thus install in dictionaric, not wanting necessarily to regive everything that has been found in lexicography. The entry compiled then is aimed at a reader who is not a linguist, nor willing to reread and reread definitions that are too dense. The information given to the reader should not be confused with the plain and simple recapture of the scientific and austere speech that is expected by the linguist. Thus, the absolute meticulousness and the care for exhaustivity which reign in the research are no longer necessarily the primary criteria: there is a need to adapt in order to explain better. The lexicographer-researcher can write for his peers when he is in the domain of the research, but when he becomes dictionarist, he doesn't write any more at all for his peers, he writes for all the readers and especially those who are not linguists. The dictionary has a didactic vocation as a tool for everybody.

Finally, have we reflected sufficiently on the fact that if it is good that the researcher knows everything possible about the functioning of the word in the language,

he should, when becoming dictionarist, not necessarily summarize it in as little space as possible, but on the contrary refer as much as possible to the particular questions that the reader asks concerning that word? Yet, the often systematic treatment of the information, in the way we do in linguistics, does not always respond to the majority of specific questions that the dictionary users ask themselves on such and such word.

There are as a matter of fact various words in the word, the “word of the language”, the “word of the speech”, the “literary word”, the “reference word”, etc. And yet, let us not forget, the word registered in the dictionary that often corresponds to a more or less successful synthesis of all these “words” hidden in a sole word, is not the word itself. The word described in the entry is not only that which has been analyzed between language and speech, it can first be perceived as the “consulted” word. And, in this capacity, the consulted word has in part its proper difficulties which often escape the homogenous rules of description, conceived for the entire group of the words in the dictionary.

A summary list was drawn up as example of these proper difficulties for certain French words, and it was noted that such a word was almost always consulted in the dictionary to raise the same problem. It is curious that there have not been organized groups of non-linguist observers, of dictionary users, noting systematically the questions that they pose to the dictionary. A big investigation of this type should be quite revealing. There is such an idea for online electronic dictionaries, when organizing an automatic observation of the questions posed, but the studies on the needs that were shown is lacking.

Thus, how do you write the French verb *rejeter* [*reject*] in the future tense: *rejetera*, *rejettera*? Nearly no dictionary considers introducing this in an example, although 80% of look-ups of the entry are for this question. For the commonly-used abbreviation, *pro* (a professional), the plural is never found, and you hesitate, can you write “pros”. Here too, consulting this word responds on the major part to this question of orthography. Indeed, for the linguist, the problem does not exist. He has in fact thought in terms of rules on the scale of the entire work, and he considers that, if he does not provide this or that information, it's because in his eyes it goes without saying. If he does not mention any particular note, it's because the general rule is followed. Obsessed as we are as lexicographers to economize space, any

saving of space is good to take, the general rule serves to gain on typographic spaces: too bad for the reader who is not aware of our obsession and who looks up a word just because he is not aware of the general regulation. This is treating with disdain the anxious look up of the user. The truth is that statistically the user never reads the introductions and he wishes for a direct reply to his queries. Thus, for the particular and complicated rules(4) of the pronominals in French which cause that “ils se sont développés” [“they have developed themselves”] does not take an ‘s’, here too, it is quite rare that the dictionaries offer the illustration hoped for in the examples. The same is true semantically where one does not expect necessarily and systematically the exhaustive description of all the semantic components of the word, but sometimes the examples clarify the referent, yesterday and today. Hardly any French person looks up the entry “chaise” [chair] for its orthography or its use in the language: here, it’s the referent that conveys it. It is therefore the referent that should be further developed in good dictionaric, yet a French language dictionary in principle does not offer an illustration. It is therefore necessary already to know what is a “chaise haute” [highchair], a “chaise longue” [deckchair], a “chaise à porteur” [sedan chair], a “chaise percée” [commode], a “chaise roulante” [wheelchair], the “chaise d’une meule” [?] in order to take advantage of these words listed in the language dictionaries, matching (not always) the definition of the more summaries.

This apparently essential distinction between the notion of *lexicography-research* and *dictionaric*, concerned with providing a pleasant and efficient tool for the user and not for the researcher, has not disappeared during the two subsequent periods. If during the second period mentioned were born, in fact, great dictionaries such as the *Dictionnaire du français contemporain* [Dictionary of Contemporary French] (1966), of a distributionalist nature, the *Trésor de la langue française* [Treasure of the French Language] (1971-1994), of a philologic nature, based on unequaled computerized textual documentation of the French language, the *Grand Larousse de la langue française* [Great Larousse of the French Language] (1971-1978), of a likewise distributionalist approach, the *Dictionnaire alphabétique et analogique de la langue française* [Alphabetic and Analogic Dictionary of the French Language] (1964; *Supplément* in 1970) by Paul Robert, in the renewed continuity

of Littré, actually, the third period that emanates from 1980 till about 1995, does further reinforce the useful distinction to be set between the lexicography and the dictionaric.

One can witness then a connection between, on the one part, the domains appropriate to the dictionaries designed for the human consultation, and, on the other part, the lexicomatic [= computational lexicography], a discipline reserved until then to computer scientists, this last discipline associating all that constitutes the base of lexical knowledges and all that refers to the machine-dictionaries for the computerized treatment of the languages and the language industries. The research assumes its full flight, the computerized means allow the works of great extent, the lexicography in its Quémadien meaning of the term is in full swing.

On the other hand, the information technology, even before the birth of the first CD-ROMs and Internet, enabled the gearing-down of the dictionaries designed for the public departing from well-nourished databases. Many small dictionaries thus appear, diversified according to the ages, the “dictionaric” may henceforth even exceed the data offered by the research, to sometimes have its autonomy, outside of the lexicography. It’s no longer the research, it’s the adaptation of the data, with so many “mixtures” with the data as its potential publics. Diversify to better sell. And it is by sometimes adapting with talent, efficiency, that the publics are acquired. This is the case of the *Dictionnaire historique de la langue française* [Historical Dictionary of the French Language] (Le Robert, 1992), for example, which presents in a pleasant way etymological information offered by the researchers, of CNRS notably. Then by contrast, providing nothing more than a fairly dull re-intermingling of information, selected, targeted at a perfectly calculated commercial profit, in the manner of a well packaged product.

To make sure that the *lexicography* does not close on itself, that the *dictionaric* does not auto-reproduce itself, this is then the course that should not be lost. Both perspectives, *lexicographical* and *dictionaric*, should remain united and complementary. Without research, there is actually no interesting future for the dictionaries. And without good dictionaric, the lexicography might stiffen and be of benefit to very few, without really attracting new competences.

As for the last period, of the very end of the 20th century and the beginning of the 21st century, marked by the

development of the Internet, it distinguishes itself primarily by the revival of editorial strategies, extended and adapted for the new virtual spaces, infinite spaces of information accessible in real time. It defines itself also by a profound metamorphosis of the look-up habits.

A problem remains: for the time being, it is mostly electronic adaptations of products, offered not long ago on paper, which are in the process of development or being offered on the market. This is the “redictionarization”, moving from paper on to computer, adding to it all the proper tags for the richest and most reciprocal look-up possible, and matching to it internet links. It nevertheless remains to invent the dictionaries conceived from the outset for the computerized medium, with no doubt real opening-ups for the hypertextual means between the encyclopedia and the language, between the synchrony and the diachrony, between the general vocabulary and the specialized vocabulary, between the textual examples and the visual, sound example, all in all synesthetic. Adding to it the lexiculture which we will expose later.

A new lexicography and a new dictionary are to be developed: the field of activity is immense. Many begin to prefer the muddled search on the Internet, certainly rich but unpredictable, on the consultation of a real “dictionary” based on this opening up, starting by not confusing *lexicography* with the *dictionary*. Already, some works take up the challenge, especially on the side of learner dictionaries. All together, on the global scale, we will not be cautious.

The Symposium on Bilingual Lexicography, Paris

Thierry Fontenelle

Thierry Fontenelle is a computational linguist and lexicographer with Microsoft's Natural Language Group in Redmond (USA), where he is responsible for the French lexical database used in a variety of NL applications. He is also currently President of the European Association for Lexicography (EURALEX) and an Associate Editor of the *International Journal of Lexicography*.
thierryf@microsoft.com

Thomas Szende is co-director of INALCO's Central and Eastern Europe Department and of the Research Centre. He has initiated and organises the international conferences on Bilingual Lexicography, and coordinates various lexicographic, translation, pedagogic and scientific projects, as well as cultural exchanges worldwide. He has written, edited and published extensively, particularly in the areas of dictionaries, lexicology, translation, and language teaching and learning.
thomas.szende@inalco.fr

The *4èmes Journées d'études sur la lexicographie bilingue* was held in Paris from 22 through 24 May 2003. Beautifully organized by Thomas Szende, who teaches at the Institut National des Langues et Civilisations Orientales (INALCO), the symposium focused on French in bilingual dictionaries and offered over 40 papers covering a wide range of topics and languages. Given the theme of the conference, presentations were in French, but the variety of bilingual dictionaries discussed was impressive, with languages ranging from English to Chinese, Arabic, Dutch, Hungarian, Italian, German, Danish, Norwegian, Swedish, Luxemburgish, Portuguese, Yiddish, Slovak, Romanian, Ladino, Turkish, Gbaya, Swahili, Bulgarian, Serbo-Croatian and Malagasy.

For space reasons, it is not possible to list the titles of all the papers, which means that highlighting some of them is somewhat subjective. The organizer managed to attract a number of established figures in the field of bilingual lexicography, such as Paul Bogaards, who discussed L2 production with a bilingual dictionary, Alain Duval, who convincingly and elegantly analyzed the expression "appeler un chat un chat" (to call a spade a spade), or Marie-Hélène Corréard, who discussed French as a target language. Other topics were also dealt with, such as lexical-semantic relations in specialized dictionaries (Jeanne Dancette), cultural aspects in specialized bilingual dictionaries (John Humbley), or the difficulty of defining scientific terms in rapidly-changing disciplines (Yves Gentilhomme). Surprisingly, few papers alluded to the use of corpora or computational techniques for compiling dictionaries. This theme was not entirely absent, however, as was shown by Serge Verlinde, Thierry Selva and Jean Binon's presentation of their work on a computerized, corpus-based French business dictionary featuring an impressive amount of lexical-semantic, syntactic and collocational information accessible via a large number of paths.

The relationship between computers, lexicography and cyberspace was also the topic of a panel discussion. This round table, moderated by Jean Pruvost (University of Cergy-Pontoise), made it possible for the panelists to explore this relationship from the point of view of the dictionary publishing world (Laurent Catach, Le Robert; Ralf Brockmeier,

Larousse), of the software world (Thierry Fontenelle, Microsoft Natural Language Group), or of the academic world (Christine Jacquet-Pfau, Collège de France; André Le Meur, University of Rennes 2; Thierry Selva, University of Leuven). The topics discussed ranged from the contents of electronic dictionaries for natural language processing to the dichotomy between electronic dictionaries for people and those for machines, as well as the increasing interest in standardization issues faced by publishers who wish to exchange data with partners. Such issues cannot be ignored, since lexical data providers who are competitors today might be partners tomorrow, and some kind of standardization is certainly desirable, as was energetically pointed out by Marie-Jeanne Derouin (Langenscheidt). Only time will tell to what extent such emerging standards for the representation of lexicographical data will gain acceptance, of course.

In a nutshell, the *4èmes Journées d'études sur la lexicographie bilingue* gave an interesting overview of bilingual French lexicography today. This was an excellent opportunity to meet representatives from the publishing world and from the academic world and to explore some of today's hot topics. Dr Szende deserves a special note of praise for his successful organization of this event hosted by the Institut Hongrois. I personally look forward to seeing the proceedings of these "Journées", which will be published by Honoré Champion, like the preceding editions. I also definitely look forward to going back to France in 2004 and hope the participants of this symposium will be eager to share their experience and expertise with a larger audience at the next congress of the European Association for Lexicography (Euralex) in Lorient (Brittany, France) in July 2004.

The conference proceedings are published by Honoré Champion, Paris, in *Collection Études de lexicologie, lexicographie et dictionnaire*, edited by Thomas Szende: **Dictionnaires bilingues: Méthodes et contenus Actes de la Première Journée** (1998). 2000.

Approches contrastives en lexicographie bilingue Actes des IIes Journées (1999). 2000.

Les écarts culturels dans les dictionnaires bilingues Actes des IIIes Journées (2000). 2003.

The Seminar on Computer-Mediated Lexicography, Castelló

Maria Carmen Campoy Cubillo

The seminar on Computer-Mediated Lexicography was held on 19-21 May 2003 at Universitat Jaume I (Castelló, Spain). Its aim was to offer a forum for discussion on how the latest developments in computerised dictionaries may challenge and change current practices in the language learning context, both in terms of content and technological advances.

Among the issues discussed, criteria to describe computer-mediated dictionaries according to the features that differentiate them from paper dictionaries was a major concern. An important aspect is that of typology, which is undergoing significant changes, particularly for online dictionaries. Dictionary typology is in need of a major revision that takes into account new computer-mediated products, and these may in turn be studied according to agreed criteria, such as genre boundaries, degrees of customisability, and functionality.

The issue of customisability was examined in relation to the teacher's and the student's roles (by Krajka). On the one hand, students may decide which dictionary and look-up modes are suitable for their purposes and styles, thus promoting learner autonomy. On the other hand, the possibility for the teacher to decide on which customisation to use for a particular learner group could be of interest within syllabus design. These perspectives are not excluding, in both cases computer-mediated dictionaries were seen as flexible tools. Although training in dictionary skills still largely depends on the teacher, now it also involves the program designer (who may be a teacher, a computer expert, or both), and on how new features are implemented in order to be taught and learned.

It was also argued (by Tono) that the electronic dictionary interface may reduce difficulties posed by paper dictionary macrostructure, which seems to be the case for hand-held and CD dictionaries. Also, computers allow for a much easier tracking of users' look-up behaviour as well as of note-taking possibilities that appear mostly with CD dictionaries.

However, this is not the case for online dictionaries, some of which provide very complex designs that add new features to the traditional macrostructure, such as links to various databases, educational pages, new terms, simultaneous search in several reference works, links to topic-related pages, etc. Likewise, as pointed out by Luzón, online dictionaries have developed

functionality features such as informational and interpersonal interactivity, which traditional dictionaries could not provide and which may turn dictionary consultation into a very complicated task.

In any case, it was clear that there is a need for both longitudinal and contrastive studies. Nesi's proposal (2000:108) "to investigate the use, not of purpose-built value glosses for a few selected texts, but of flexible support for all texts in the form of independent electronic dictionaries," could be extended to all kinds of computer-mediated dictionaries both for value and signification glosses as described by Roby (1999). Research is needed, I believe, not only in the use of actual dictionaries (as opposed to partial ones designed for specific tasks) but also in the promotion of dictionary-use skills as part of metacognitive learning strategies. In so doing, dictionaries should be considered as part of the learning process rather than as a learning tool for solving problems or a compensatory strategy.

Research on computerised dictionaries should also be concerned with aspects that are typical in the new genres. For example, taking into account that sound files are included in most products, and that the majority of learners find the sound option attractive, research should be carried out on how audio files are used – not only to know how a word is pronounced, but to understand spoken texts.

For most (young) learners, the integration of dictionaries into the world of computers has endowed them with a new attraction. This engaging new look appears to be leading to a more frequent enjoyable use and greater familiarity with the dictionary, while helping learners improve their vocabulary and language knowledge. Learners' motivation should be taken advantage of on the side of the teachers, while encouraging them to examine their students' needs and the new ways to present them with lexical information.

The International Schools on Lexicography at Ivanovo State University

Olga Karpova

Olga Karpova is the Head of the English Philology Department at Ivanovo State University and the university's Vice-Rector for Public Relations. She has written extensively on lexicography and dictionaries, received foreign and local awards and grants, participated in many international conferences, and since 1995 she organizes the lexicographical schools at Ivanovo and edits their proceedings. Professor Karpova specializes in Shakespeare dictionaries and translation, and her main interests include authors' lexicography, English stylistics and discourse analysis.
omk@ivanovo.ac.ru

The idea of holding International Schools on Lexicography at Ivanovo State University goes back to 1992, after the EURALEX Congress in Tampere. In spite of the fact that the EURALEX congresses are held every two years, to our regret, only few Russian scientists attend them due to financial reasons. That is why we decided to organize International Schools on Lexicography regularly every two years, between EURALEX congresses, in Russia and to host them at our university, where we have stable lexicographic traditions.

The topic Contemporary Problems of Theoretic and Applied Lexicography at the English Language Department is one of the leading themes of research at Ivanovo State University. Since 1996 ten postgraduate thesis and fifty final projects have been defended on general and special purpose dictionaries: authors', learners', several LSP (architecture, stock market and finance) and new words dictionaries, etc.

Special courses in modern and historical lexicography are delivered at the department, with about 25 students annually attending and writing course projects in lexicography. There is a student scientific society in lexicography, LEXICOGRAPHICA, that works quite successfully. Being a collective member of EURALEX, Ivanovo State University regularly receives the *International Journal of Lexicography*, as well as the latest news about conferences, workshops and publications.

The aims of the Ivanovo Schools in Lexicography (which have acquired in the course of time the status of an international conference) are to give young scholars a good opportunity to learn current tendencies in foreign and Russian lexicography through plenary lectures of invited prominent scholars and to present their own research results and dictionary projects, dictionary surveys, etc.

Our University has already held four Schools on Lexicography, with about 160 participants on average, hosting world famous lexicographers and scholars:

1995: Theoretical and Practical Aspects of Lexicography, guest lecturer: R.R.K. Hartmann.

1997: Problems of Bilingual Lexicography, guest lecturer: Krista Varantola.

1999: The Dictionary in the Contemporary World, guest-lecturer: Ruth Vatvedt Fjeld.

2001: Language. Culture. Dictionaries, guest lecturers: Svetlana G. Ter-Minasova and Kenneth A. Haseley. (<http://lcd2001.narod.ru>)

The results of the Schools' work were published in the form of proceedings and conference materials.

The last conference aroused great interest in Russia and abroad. Professor Ter-Minasova, Dean of the Faculty of Foreign Languages at the Moscow State University, delivered three lectures: The Life of a Word in Speech and Dictionaries; Foreign Languages Teaching – Science, Art or Politics?; and Linguistic and Extralinguistic Problems of Intercultural Communication. Professor Emeritus of Ivanovo State University, Kenneth A. Haseley, presented two reports: The New Communicators: What Research Can Teach Us About Effective Communication; and Handling Questions and Answers: Guidelines for Comfort and Success. There were also plenary lectures by prominent Russian scholars and guest-lecturers from Croatia. Besides the outstanding representatives of Russian Lexicography there were senior university teachers and post-graduates who got an excellent opportunity to share the results of their scientific work, get them valued and appreciated. Above all, the lectures were attended by the senior and junior students of regional universities, who also took great interest in the conference. Altogether, 26 plenary lectures and 80 session reports were delivered during the three days of the conference.

The 5th International School on Lexicography, with the subject, Theoretical Lexicography: Modern Tendencies of Development, will be held on September 8-10, 2003. Guest lecturers include Dmitry Dobrovolsky, Moscow State University, and Bertha Marie Toft, University of Southern Denmark.

The conference will include sessions on Historical Lexicography, LSP Lexicography, Computer Dictionaries, and New Dictionary Projects. The working languages are English and Russian. The Organizing Committee is planning to publish the Conference Proceedings.

The Third ASIALEX International Congress, Tokyo

Shigeru Yamada

It is our great pleasure to host the Third ASIALEX International Congress in Japan this summer. Soon after Professor Minoru Murata was elected President at the Seoul conference two years ago, the organizing committee was set up. The 29 members have been working hard toward a successful conference under his leadership. Professor Murata retired from Chiba University at the end of March, but will be denied the promised luxury of free time until the end of the conference.

The conference takes place at Meikai University in Urayasu, located between Narita Airport and Tokyo, close to the site of Tokyo Disneyland. Prof Yukio Tono, the Secretary, teaches at this university, and holds much responsibility for this event on his shoulders. There are expected to be no financial difficulties at all with Professor Murata on our side. He has never been in the red throughout his long career, in which he served as treasurer for many societies and conferences, including AILA 1999 Tokyo.

We are proud of the program of the conference – of its content, quality, and variety. There will be six symposiums, 60 papers and 13 poster presentations, as well as exhibitions by dictionary publishers and software companies. The conference will feature plenary lectures by Henri Béjoint, Adam Kilgarriff, Tokihisa Kurashima, Kosei Minamide, and Anne Pakir. In addition, we are glad that Reinhard Hartmann and Tom McArthur have agreed to join in the line-up with the following lectures:

- Hartmann: Why lexicography needs a strong academic foundation
- McArthur: What on earth is English – a world, an international, or a global language?

The opening ceremony will include an award ceremony for the Kernerman Dictionary Research Grants, which was won by the project “A glossary of essential academic vocabulary” by Dr. Jacqueline Lam Kam-mei and her team, from Hong Kong University of Science and Technology. Prior to the conference, the Brighton intensive computer lexicography course will be offered by Adam Kilgarriff and Michael Rundell. This course is held at Senshu University, Tokyo, on 25-26 August, at a discount rate for the conference participants.

Asia is a vast area with diverse peoples, languages, and ancient traditions of dictionaries. Asialex should function as an institution and forum which brings people together to discuss, study, and promote lexicography within and beyond Asia. To serve its purpose and people, the latest addition to the “lex” family must grow as an academic association. Such issues as membership, fees, and the publication of a journal should be discussed in the business meeting.

All in all, this is going to be a busy and exciting week. Preparation is well underway, and we look forward to seeing many of you soon at Meikai.

Shigeru Yamada studied lexicography at the graduate schools of Waseda University, Tokyo, and the University of Exeter, UK. His interests include EFL and bilingual lexicography. He contributed as a lexicographer to Luminous Japanese-English Dictionary (2001) and Kenkyusha New English-Japanese Dictionary (6e., 2002). He is currently an associate professor at Waseda University, and the Asialex Treasurer.
shyamada@waseda.co.jp

The ASIALEX Landmarks

- The Asian Association for Lexicography was established in March 1997, during the Dictionaries in Asia conference that was held at the Language Centre of Hong Kong University of Science and Technology, at the initiation of Gregory James and Ami Chi.
- The major objective of Asialex is to foster scholarly and professional activities in the field of lexicography in Asia.
- Several papers from the inauguration conference were published under the title *Lexicography in Asia* (eds. McArthur T. and I. Kernerman, Password Publishers, Tel Aviv, 1998).
- The first Asialex international conference was held at Guangdong University of Foreign Studies, Guangzhou, China, in 1999. It was organized by the first Asialex President, Professor Huang Jianhua, and had two major themes: ‘National experience in lexicography or dictionary compilation’, and ‘Bilingual lexicography’.
- The second Asialex international conference was held at Yonsei University, Seoul, Korea, in 2001. It was organized by the second Asialex President, Professor Sangsup Lee, and had the major theme of ‘Asian Bilingualism and the Dictionary’.
- The proceedings of each Asialex conference are available from its organizers.

The Third Biennial Conference of the Asian Association for Lexicography (ASIALEX) is entitled ‘**Dictionaries and Language Learning: How can dictionaries help human & machine learning?**’. It will be held at Meikai University, Urayasu, Chiba, Japan, 27-29 August 2003. For registration and details, please visit the conference website:
<http://www.asialex.org>.

A Lifestory in Dictionaries

Peter H. Collin

Peter Hodgson Collin served in the Royal Navy, then studied modern languages in Oxford. He worked as a lecturer in Canada and Hong Kong, edited dictionaries and directed dictionary publishing with Harrap and Macmillan in London, and in 1985 founded his own dictionary publishing house that was sold last year to Bloomsbury. Altogether, Mr Collin has been involved in the making of scores of dictionaries in the UK and in many languages worldwide. At present he is the Chairman and Editorial Director of Modern English Publishing.

Dictionary

As often happens, I got into what turned out to be my life's work—working on dictionaries—by accident.

When I left Oxford with a degree in modern languages, I wanted to work with books, and so wrote to several publishers. I got a job almost immediately with Harrap, at that time the leading publisher in school textbooks for language learners, and also, incidentally, an important bilingual dictionary publisher¹.

In 1958 I started work in the Harrap offices, at the top of the old building in High Holborn, up flights of back stairs (the editorial staff weren't supposed to use the main stairs or lift) in a room about 6x6m, with two small windows looking out over rooftops, where four or five of us schoolbook editors and a secretary worked in Dickensian squalor. The first chore every morning in winter was to light the small and very smelly gas fire. Desk lights were on all day, as the windows were small. Although I was employed to work on school textbooks (my first jobs were to edit a new Russian course for beginners and a university edition of a French medieval text), very quickly I found myself helping out with the new Supplement to the big Mansion French/English dictionary, adding new entries, looking for translations for new words, making up examples, and eventually proofreading. After a few more months I was working on it more than half-time, and the schoolbooks receded into the background.

After the third supplement came out, the decision was taken to produce a whole new edition of the Mansion dictionary, and this was organized partly in the office, with several editors (one of whom, Françoise, I married), and by freelancers all over the place: there was a specialist who dealt only with names of birds; there was one who supplied the phonetics for the French side; there was a lady in Pau who sent in masses of handwritten notes of things she had read in French newspapers; there was an elderly Polish refugee whose very fiddly job it was to cut up a copy of the existing dictionary and stick each word entry down on a filing card, so that new entries could be added on new cards. The cards were stored in drawers in wooden racks. In those days (the early 1960s) there were no computers, although we had demonstrations of card-based inventories which we thought might be useful. In the end, we kept to the old system, and sent the cards off periodically

to be typeset (using metal setting, of course); our printers employed typesetters who worked only on that dictionary.

After a while my wife and I decided that we wanted to travel, so I got a job teaching in Canada (Dalhousie University, Halifax, Nova Scotia), and after five years there, went to teach at the University of Hong Kong for another five years. But we still kept in contact with Harrap, and proofread dictionaries all the time (1963-1972).

Then I was asked if I wanted to go back to Harrap, firstly to run the schoolbooks department, and then to take over as director of the dictionary publishing as well.

Although we were now in the mid-1970s, there were still no computers involved in the compilation processes, but some very advanced printers were typesetting from punched tapes. I remember discovering that the paper tapes of one of our dictionaries had been thrown away by the printers once the pages had been typeset, and I went down to their offices and searched through the dustbins to retrieve this mass of paper ribbons, which I felt somehow could be used (and indeed they were converted to very early computerized data).

During this stage of my work at Harrap, not only did we produce new editions of all the major bilingual dictionaries, but I also launched a new series of smaller bilingual dictionaries in Spanish and German, plus the first of several monolingual English learner dictionaries. These spawned a small series of semi-bilingual dictionaries in French, German, Dutch, Afrikaans, Arabic² and other languages.

In 1983, I was approached by Macmillan Inc (New York) to see if I would be willing to set up a whole new dictionary division in London to produce a series of bilingual dictionaries in several languages, simultaneously. The languages were to be English, French, Spanish, and German, with the possibility of adding Portuguese and Italian later. The dictionaries were intended to replace the old Cassell dictionaries (owned by Macmillan at that time). The whole project was to be computerized, and Macmillan were prepared to put a large amount of money into it. So I moved from Harrap, and started all over again.

Firstly we needed to find offices, and then staff, and we were lucky to find main language editors who all had dictionary experience; we then recruited numbers of junior editors and opened our main office

in Golden Square, with little offices in various parts of the world; compilation started on source files for each language and within two years we employed around 90 full-time and part-time staff. Although the different languages had different grammatical requirements, we were able to draw up standardized entry forms and compilation was done on paper while the decision on the computer system still had to be made. After two years' compilation most of the source files were more or less complete and were ready to be transferred to computer.

At that stage, I felt that my role was becoming less relevant, and I also wanted to start up something on my own, which I would actually own. So I left Macmillan and formed a new company, Peter Collin Publishing Ltd (or PCP for short) in 1985. I knew exactly what dictionaries to produce, because I could see that there was a gap in the market for English learners' dictionaries in the specialist subjects which were becoming widely taught as part of ELT courses, in particular Business, Legal and Medical English.

Because I wanted the material to be computerized from the start (as opposed to Macmillan where the choice of a computer system took about two years) and I didn't want to use any of the existing compilation systems which were both expensive and derived from other large dictionary projects, I devised my own internal coding system for each part of an entry (headword, phonetics, part of speech, definition, example, quotation, etc.) and bought my first small computer (an Apricot, which in those days had no memory, so that everything had to be stored on diskettes). The great day was when the first draft text was sent to a typesetter for testing and came back exactly as we wanted: this showed that our internal codes could generate typesetting in multiple fonts, different point sizes and with boxes to highlight parts of the text. It also gave us the flexibility to change the appearance of the dictionary page at will.

Compilation of the first two dictionaries (Business and Law) took about six months, so that for the Frankfurt Book Fair in 1986 my wife and I actually had two books on our little stand. Shortly afterwards, we signed agreements with Klett in Germany and Norstedts in Sweden, to use our data to make our first bilingual dictionaries. Again, the simple coding system proved invaluable in compiling bilingual versions, and diskettes of our texts were sent all over the world to have translations added: it proved surprisingly simple to take the original English text and add translations

to make semi-bilingual dictionaries. This process continued over several years, with dictionaries appearing in Chinese, Slovenian, Polish, Czech and other languages, all compiled locally using our material. It was interesting to go to one of the Chinese publishing houses (the China Financial Press, Beijing) and see the text which had been imported from our diskettes appearing on screen, and the Chinese translations being added as we watched.

We also decided to make our own big bilingual dictionaries in French, German and Spanish, for which I recruited specialist translators in various parts of the world.

All this required more and more computer skills, and my son Simon left his job as the technical editor of a computer magazine to join the family company and help run the business. By our 17th birthday in 2002 we had over 100 titles, mainly dictionaries, in fifteen different languages, and sales in almost every country of the world. However, it was becoming more of a strain to fund the new projects, and without new projects I felt that the company could not continue to develop. We had the distinction of being the only privately owned English dictionary publisher, and this made the company attractive to others. It was not unexpected, but a surprise nevertheless, when Bloomsbury, the publisher of the Encarta dictionaries (and Harry Potter!), suddenly made us an offer out of the blue. The PCP dictionaries have now moved to Bloomsbury and form the basis of the new Bloomsbury Reference list. They are being actively updated, and I am still involved to a certain extent in this process.

Because I didn't want to retire, we decided to move into magazine publishing, and set up a new company, Modern English Publishing Ltd³. We were lucky to acquire three ELT magazines, alongside which we are publishing a series of practical guides for teachers of English as a Foreign Language.

There is life after lexicography, after all!

Notes

1 The company was called at the time George G Harrap Ltd, then Harrap Ltd. Now it is part of Chambers Harrap Publishers Ltd, based in Edinburgh, owned by Larousse PLC.

2 *Harrap's Standard English Learner's Dictionary* served as a base for Kernerman's semi-bilingual Arabic (1987), Italian (1987), Chinese (1990), and Spanish (1991) editions.

The Kernerman Dictionary

Three applications for the Kernerman Dictionary Research Grants have been accepted for 2002: The Assessment Committee of Afrilex awarded a grant to Karen Hendriks, from the University of Stellenbosch, for her research on the particular needs of a multilingual society and their effects over the structure and nature of bilingual dictionaries, and a grant to P.M. Lubisi, from the University of Pretoria for his project to build a major corpus for siSwati, one of the official Bantu languages of South Africa. The Asialex committee awarded a grant to Jacqueline Lam Kam-mei and her team from Hong Kong University of Science and Technology for their project to create a glossary of academic vocabulary.

A Glossary of Essential Academic Vocabulary

Jacqueline Lam Kam-mei with Sue Chang and Gregory James

Research has shown that word-lists have an important role to play in acquiring a language other than the mother tongue. At the university level, students need to be equipped with a sufficient vocabulary to follow lectures, comprehend academic texts, participate in seminar discussions, and write coherent research papers. Learners need to be familiar with at least 95% of the running words in a text if they hope to achieve these ends. Failure to acquire the core academic vocabulary for their field will adversely affect their work. A well-selected word-list based on academic texts used in tertiary institutions is therefore essential to help new entrants to acquire as many vocabulary items as possible in a relatively short time, so that they can cope with the heavy university student load once they have enrolled.

Based on the afore-mentioned rationale, a team of researchers, directed by Gregory James, at the Language Centre of the Hong Kong University of Science & Technology, have compiled five properly sampled electronic datasets of texts extracted from first-year textbooks used by university students in Hong Kong since 1991. These corpora, which have now been completed, comprise c.1,000,000 words in each of the following disciplines: (i) Computer Science, (ii) Business Studies & Economics, (iii) Biology, Biochemistry & Chemistry, (iv) Engineering and (v) Humanities & Social Science.

The proposed project represents a coherent and long-term strategy aimed at providing undergraduates and potential university students with an academic word-list which will enhance their knowledge of academic vocabulary, thus improving their ability to cope with a three-year university programme.

The project aims, firstly, to identify a list of frequently occurring academic words appearing across the five corpora mentioned. This list (hereafter the HKUST Wordlist) will contain those content words most useful for academic reading comprehension, discussions and paper writing. The second aim is to develop a glossary, based on the HKUST wordlist, that will include key features such as definitions, examples in context and examples of usage informed by relevant corpora and pronunciation. Other features will be considered and included subsequently as a result of feedback from user-perspective surveys.

All tertiary-level students, but first-year undergraduates in particular, in Hong Kong would benefit from this project through a systematically planned vocabulary learning scheme based on the HKUST Wordlist. Another group benefiting

from this project would be students in Secondary Forms 6 and 7 intending to pursue further studies at tertiary level in the Science and Technology streams. Through using the proposed HKUST Wordlist, students could better equip themselves to make the often difficult transition from general or secondary academic reading/writing to tertiary academic reading/writing. More importantly, the proposed HKUST Wordlist will serve as useful reference material for language materials designers, when seeking to produce appropriate language learning and teaching materials to enhance their students' language proficiency.

The project has three main phases:

Phase One:

1. Identifying and generating word-lists including single words, compound words and distinctive phrases (bi-grams, tri-grams, etc.) in each corpus;
2. Identifying words and n-grams that appear in all five corpora and generating a unified word-list across five disciplines;
3. Devising and implementing measures to confirm the reliability of the word-list compiled.

Phase Two:

4. Designing and compiling the prototype HKUST Wordlist in both paper and electronic form by
 - 4.1 determining headwords;
 - 4.2 writing definitions;
 - 4.3 illustrating definitions through appropriate phrases and sentences from the corpora;
 - 4.4 exemplifying word usage;
 - 4.5 including phonetic symbols for pronunciation help;
5. Designing and engaging in user-perspective surveys;
6. Collating and analysing survey feedback.

Phase Three:

7. Designing and compiling the HKUST Wordlist;
8. Developing training materials and vocabulary acquisition workshops and seminars, based on the HKUST Wordlist, to ensure students learn the words.

Once the framework for the HKUST Wordlist has been developed, it is envisaged that word-lists for learners at different levels and disciplines, for example, more discipline-specific lists for undergraduates, could also be compiled for use.

Research Grants

Certain Aspects of Bilingual Dictionaries in Multicultural and Multilingual Societies

Karen Hendriks

South Africans live in a culturally and linguistically diverse society with eleven official languages. The country has a complex political history, which cannot be severed from sensitive issues concerning language and communication. The process of acknowledging the truth and working towards reconciliation has been on its way for several years, yet the people of South Africa still have a long way to go in order to be able to genuinely celebrate their diversity rather than be threatened by it. I believe that lexicography, and specifically, good bilingual dictionaries, can make a vital contribution to the process of reconciliation, of affirmative action, and of building a nation out of the diverse speech communities and cultures in South Africa.

Bilingual dictionaries play an extremely important role in a multilingual society; they can be perceived as the key instruments in the communication between different communities. Efficient and active communication between different cultural groups is essential in the South African environment. Culture-specific lexical items, and the way they are treated in bilingual dictionaries, can have a great influence on this process. In the past, South African dictionaries have displayed a strong cultural bias in the treatment of these items. Today, lexicographers have to face the reality of the lexicographic wrongs of the past, and correct this in dictionaries for the present-day user.

My study will focus on the way the particular needs of a multilingual society imply certain adaptations to the structure and nature of a bilingual dictionary. In a multilingual and multicultural context the lexicographer may not rely on the intuition of the user, and the needs of different user groups have to be accommodated. The lexicographer has to keep in mind that the user of a general-purpose bilingual dictionary may well also be a learner of the target language.

Furthermore, I plan to examine the admission and treatment of culture-specific lexical items in bilingual dictionaries intended for a multilingual environment. Considering the vitality of enhancing clear and effective communication between speakers of different languages, the misrepresentation of culture-specific lexical items in bilingual dictionaries could seriously impede communication rather than enhance it. It is of great importance that lexicographers have adequate guidance in the treatment of these items.

South Africa is not the only country in the world with a multilingual and culturally diverse society. Users worldwide could benefit from a comprehensive study of the way dictionaries can contribute to and enhance communication between different cultural groups. I intend to examine the situation concerning this issue in South Africa and then to make suggestions and provide guidelines for the treatment of culture-specific lexical items in bilingual dictionaries that would apply to any multilingual environment.

Corpus Building for the SiSwati Dictionary Unit

P.M. Lubisi

SiSwati is one of the 11 official languages in the Republic of South Africa, spoken by about one and a half million people. It is, however, one of the least developed and underprivileged of these languages. There is not a single monolingual dictionary in siSwati, and the terminology development of this language is in its infancy. The first matriculants in siSwati were in 1987, and there is still only a small number of published materials, most of which are based on the school curriculum. SiSwati is offered at only two universities in South Africa, and no teacher training college is offering it.

Although the government, through the Pan South African Language Board, is in the process of establishing lexicography units, languages like siSwati will still be disadvantaged because of the lack of human capacity and resources. The siSwati lexicography unit is housed in a technicon that does not offer the language as a course, and this unit will receive little academic assistance. Lexicography is foreign in many technicons, including Pretoria Technicon, let alone corpus building. SiSwati has no professional lexicographers, and there are hardly any students who hold senior degrees in this language. Hence, it is developing at a snail's pace. Assistance is afoot in the collection of printed data, yet no attempt has been made to collect oral data from the siSwati radio stations, so a grant of this nature can play a pivotal role in the building of such a corpus. Moreover, it will allow enough time to do thorough research in this regard.

The aim of this project is to carry out a thorough research on corpus building for siSwati, by way of collecting data, especially oral data and information stored on tapes at the only two radio stations, namely Ligwalala FM in South Africa, and the Swaziland Broadcasting Corporation. There is a mammoth task to be done to retrieve this information as the unit does not at present have the necessary software to deal with this matter. The first stage of the project will concentrate on the oral literature, and will be conducted in the rural part of Mpumalanga lowveld, and in the four districts in Swaziland. A good tape recorder will be needed to record the oral data. The researcher will be assisted by veterans like Professor Daan Prinsloo from the University of Pretoria, who have already made inroads in this field. The university's department of African languages has accepted this project, and is actively participating in the building process and offers full access to all its resources and expertise. In addition, a major publishing house (Macmillan) has agreed to permit the use of their siSwati material. The collection of oral data is expected to gain full momentum by the receipt of the grant. The study is invaluable for the development and compilation of siSwati dictionaries in that it will be the first of its kind in this language. The gained know-how will be used also to assist other units that are still struggling to build their corpus.

The Third Edition of Oxford Student's Dictionary for Hebrew Speakers

Oxford Student's Dictionary English-English-Hebrew

Kernerman Publishing and
Lonnie Kahn Publishing

ISBN 965-307-034-7

Softcover, 984 pp.

150x230x48mm.

Based on *Oxford Student's
Dictionary*, OUP, 2001

Hebrew edition: July 2003

Translation: Ya'acov Levy

Editor: Raphael Gefen

OSDEEH includes:

Entries consisting of

- headwords
- definitions, in English
- parts of speech of the headwords, together with other grammatical information (*countable/uncountable nouns, transitive/intransitive verbs*, etc.)

- idioms

- example phrases and sentences

- the Hebrew translation of the headwords (and where necessary also of idiomatic expressions found in the example sentences)

- usage notes

- opposites and synonyms

- register and style (*formal, informal, technical*)

Charts, diagrams and pictures

Appendices (irregular

verbs, affixes, geographical names, expressions using numbers)

Published on January 1, 1986, Oxford Student's Dictionary for Hebrew Speakers (OSDHS) was not the first of its kind. Several semi-bilingual dictionaries (SBD) for learners of English at the elementary-to-lower-intermediate level were published before that:

- In 1982, Longman co-published with AO Livro Technico, in Brasil, a 10,000-word SBD, entitled *Longman English Dictionary for Portuguese Speakers*, by Rosa W. Konder.

- In the same year, Harrap published an SBD written by P.H. Collin, called *Harrap's Dictionnaire de 2000 Mots, Anglais-Francais*.

- In Beirut, Librairie du Liban published a 20,000-word SBD in 1985: *Al-Mufid, A Learner's English-Arabic Dictionary*, by Nasr and Al-Khatib.

- OUP published that year a 2500-word SBD called *First Dictionary for French-Speaking Africa*.

It is possible that other SBDs appeared before that have not come to my attention. Other dictionaries I have occasionally heard about turned out to be not semi-bilingual but rather, to use R.R.K. Hartmann's term, "bilingualized", in which not only the headword is translated, but the definitions and/or examples are translated as well.

In Israel, the appearance of OSDHS and, in 1987, *Harrap's English Dictionary for Speakers of Arabic*, marked the first official recognition of the use of the mother tongue in the foreign language classroom. The acceptance was so universal, that it has eventually become the only type of dictionary permitted in the English matriculation examinations, which are themselves geared to this dictionary. Monolingual dictionaries are not permitted in the school system at all, and bilingual dictionaries may be used by students at the lower level of matriculation.

OSDHS has had over 50 reprintings of two editions (2e published in 1993). This impact on pedagogical lexicography and English learners' dictionaries goes well beyond Israel, in many countries and languages worldwide.

Lionel Kernerman, Publisher

The new edition of *Oxford Student's Dictionary English-English-Hebrew* is based on the third edition of *Oxford Student's Dictionary* (OSD, Oxford University Press, 2001), and as such is a most up-to-date dictionary for learners of English as a foreign language at the upper-intermediate level, suitable for the upper grades of secondary (high) schools, universities, the professions and the general public.

The OSD has been adapted for the use of Hebrew speakers, not only by translating all the entries and subentries, but also by making it particularly relevant to Israeli users, e.g. by adding a large number of entries and subentries (especially words commonly used in Israeli educational institutions and local textbooks).

The former editions of this dictionary have been in use for over 25 years as auxiliary material in class and in examinations. When the semi-bilingual dictionary first appeared, it was soon recognized to be far more useful than the monolingual OSD used in class previously, which had been hardly referred to by examinees or indeed by students in their regular lessons. Hitherto, students had tended to use a bilingual dictionary, but the advantages of the semi-bilingual type were immediately evident, with the explanations in simple English, i.e. the language of instruction in the communicative framework of the English curriculum and methodology, and the numerous examples (after all, "meaning lies in the context")—features of the monolingual dictionary—but now also with the satisfying and confirming existence of the Hebrew translation of the headword.

This edition has been totally rewritten, taking into account advances in linguistics, teaching methodology and lexicography, and covering areas such as hi-tech in general and computers in particular, as well as business studies, the sciences and professions, education, literature and the arts, tourism and communication needs in general. Dictionary has over 47,000 references. The definitions and examples are in British spelling, but the American equivalents are also given. Thus, *faucet* is given as the American equivalent of *tap*, both as part of the entry for *tap* and as a separate entry.

Raphael Gefen, Editor
